## 1. APPLICATION

The RE82 controller is destined for the temperature control in plastics, food, dehydration industries and everywhere when the temperature change stabilization is necessary.
The measuring input is universal for resistance thermometers (RTD), thermocouple sensors (TC), or for linear standard signals.
The controller has four outputs enabling the two-step control, step-by-step three-step control, three-step control of heating-cooling type and alarm signaling. The two-step control is acc. to the PID or ON-OFF algorithm.
The innovative SMART PID algorithm has been implemented in the controller.

## 2. CONTROLLER SET

The delivered controller set is composed of:

1. RE82 controller................................................... 1 pc
2. plug with 16 screw terminals............................... 2 pcs
3. screw clamp to fix the controller in the panel....... 4 pcs
4. seal.................................................................... 1 pc
5. user's manual..................................................... 1 pcs
6. guarantee card.................................................... 1 pc

When unpacking the controller, please check whether the type and version code on the data plate correspond to the order.

## 3. BASIC REQUIREMENTS, OPERATIONAL SAFETY

In the safety service scope, the controller meets to requirements of the EN 61010-1 standard.

## Observations Concerning the Operational Safety:

- All operations concerning transport, installation, and commissioning as well as maintenance, must be carried out by qualified, skilled personnel, and national regulations for the prevention of accidents must be observed.
- Before switching the controller on, one must check the correctness of connections to the network.
- Do not connect the controller to the network through an autotransformer.
- The removal of the controller casing during the guarantee contract period may cause its cancellation.
- The controller fulfills requirements related to electromagnetic compatibility in the industrial environment
- When connecting the supply, one must remember that a switch or a circuit-breaker should be installed in the room. This switch should be located near the device, easy accessible by the operator, and suitably marked as an element switching the controller off.
- Non-authorized removal of the casing, inappropriate use, incorrect installation or operation, create the risk of injury to personnel or controller damage.

For more detailed information, please study the User's Manual.

## 4. INSTALLATION

### 4.1. Controller Installation

Fix the controller in the panel, which the thickness should
not exceed 15 mm , by means of four screw clamps acc. to the fig. 1 . The panel cut-out should have $45^{+0,6} \times 92^{+0,6} \mathrm{~mm}$.

Fig. 1 Controller fixing in the panel
RE82 controller overall dimensions are presented on the fig. 2.

Fig. 2. Controller dimensions.

### 4.2. Electrical Connections

The controller has two separable terminal strips with screw terminals. Strips enable to connect all signals by a wire of $2.5 \mathrm{~mm}^{2}$ cross-section.

Fig. 3. View of controller connecting strips.

Fig. 4. Supply.

Fig. 5. Input signals.

Fig. 6. Additional input signal.

Fig. 8. Binary input 1 and 2

Fig. 10. RS-485 Interface

Fig. 9. Current transformer input.

Fig. 11. Transducer supply 24V

### 4.3. Installation Recommendations

In order to obtain a full fastness against electromagnetic noise, it is recommended to observe following principles:

- do not supply the controller from the network in the proximity of devices generating high pulse noises and do not apply common earthing circuits,
- apply network filters,
- wires leading measuring signals should be twisted in pairs, and for resistance sensors in 3-wire connection, twisted of wires of the same length, cross-section and resistance, and led in a shield as above,
- all shields should be one-side earthed or connected to the protection wire, the nearest possible to the controller,
- apply the general principle, that wires leading different signals should be led at the maximal distance between them ( no less than 30 cm ), and the crossing of these groups of wires made at right angle ( $90^{\circ}$ ).

## 5. STARTING TO WORK

After turning the supply on, the controller carries out the display test, displays the $-\varepsilon g \Sigma^{3}$, inscription, the program version and next, displays the measured and set value.
A character message informing about abnormalities may appear on the display (table 18).
The PID control algorithm with the proportional range $30^{\circ} \mathrm{C}$, a 300 seconds' integration time constant, a 60 seconds' differentiation time constant and a 20 seconds' pulse period are set by the manufacturer.

## Changing the Set Point Value

One can change the set point value by pressing the $\square$ or

-(push-button (fig. 12). The beginning of change is signaled by the flickering dot of the lower display. One must accept the new set point value by holding down the $\longleftarrow \sim$ push-button during 30 seconds since the last pressure of the $\nabla$ or $\square$ push-button. In the contrary, the old value will be restored. The change limitation is set by parameters SPLi and SPLH.

## 6. SERVICE

The controller service is presented on the fig. 13

### 6.1. Programming Controller Parameters

The pressure and holding down the $\longleftarrow$ push-button during ca 2 sec. causes the entry in the programming matrix. The programming matrix can be protected by an access code. In case when giving a wrong value of the code, it is only possible to see settings through - without the possibility of changes.

The fig 14. presents the transition matrix in the programming mode. The transition between levels is carrying out by means of $\boldsymbol{\nabla}$ or $\boldsymbol{\Delta}$, push-buttons and the level selection by means of the $\longleftarrow$ push-button. After selecting the level, the transition between parameters is carried out by means of $\nabla$ or $\Delta$ push-buttons. In order to change the parameter setting, one must proceed acc. to the section 6.3. In order to exit from the selected level, one must transit between parameters until the symbol [. . .] appears and press the $\longleftarrow$ push-button.

In order to exit from the programming matrix to the normal working mode, one must transit between levels until the symbol [. . .] appears and press the $\longleftarrow$ push-button.

Some controller parameters can be invisible - it depends on the current configuration.

The table 1 includes the description of parameters. The return to the normal working mode follows automatically after 30 seconds since the last push-button pressure.

### 6.3. Setting Change

The change of the parameter setting begins after pressing the $\longleftarrow$ push-button during the display of the parameter name. The setting selection is carried out through $\qquad$ and $\qquad$ pushbuttons, and accepted by the $\square$ push-button. The change cancellation follows after pressing of $\sim$ push-button or automatically after 30 sec since the last push-button pressure.
The way to change the setting is shown on the fig. 15.

Fig. 15. Change of number, text and time parameter settings.

### 6.4. Parameter Description

The list of parameters in the menu is presented in the table 1.

## 7. CONTROLLER INPUTS AND OUTPUTS

### 7.1. Main Measuring Inputs

The main input is the source of measured value taking part in control and alarms.

The main input is an universal input, to which one can connect different types of sensors or standard signals. The selection of the input signal type is made by the parameter,$n t s$.
The position of the decimal point which defines the display format of the measured and the set point value is set by the parameter $d^{p}$. For linear inputs, one must set the indication for the lower and upper analog input threshold, nio o and inh,
The correction of the measured value indication is carried out by the parameter Shir.

### 7.2. Additional Measuring Inputs

The additional input can be the source of remote set point value ( 5 P.id set on,$\cap \Omega^{3}$ ) or the signal for retransmission (RoFn set on Pe?).

The additional input is a linear input. The selection of the input signal type is possible between $0 \ldots 20 \mathrm{~mA}$ and $4 \ldots 20 \mathrm{~mA}$ by the parameter, 2.5 . The position of decimal point which defines the display format of the measured and set point value is set by the parameter $\boldsymbol{o p}^{2} ?^{2}$. One must also set the indication for the lower and upper analog input threshold, 2.20 and 2 Eh .

The signal from the additional input is displayed with the character ", $\sigma^{\prime \prime}$ on the first position. To display the value, one must hold down
$\square$ push-button till the moment of its appearance on the lower display (acc. to the fig. 13.) The return to display the set point value is set by the manufacturer for 30 sec , but it can be changed, or disabled by the parameter cout.

### 7.3. Binary Inputs

Functions of binary input are set by bne $i$ and bne $?$ parameters. For each input must be set a different function.
Following binary input functions are available:
without functions - the binary input state does not influence the controller operation,

- control stop - the control is interrupted, and control outputs are behaved as after a sensor damage, alarm and retransmission operate independently,
- switching on manual operation - transition to the manual control mode'
switching SP on SP2 - change of the set point value during the control,
erasing of the timer alarm - disabling of the relay responsible for the timer alarm,
program start - the programming control process begins (after a prior set of the programming control),
- jump to the next segment - the transition to the next segment follows, during the duration of the programming control
stoppage to count the set point value in the program the stoppage of set point value counting follows, during the duration of the programming control
- change of the set point value - after the configuration of two inputs, one for decreasing and one for decreasing the set point value, one can replace the change by upward and downward pushbuttons for changing through binary inputs,
switching SP on IN2 - change the set point value during the control between the SP and the value of the additional input (5P.id parameter must be set to $5 \rho, n$, the other binary input cannot have set the function switching SP on SP2).

### 7.4. Outputs

The controller has four outputs. Each of them can be configured as a control or an alarm output.
For the proportional control (with the exception of analog outputs), the pulse period is set additionally.
The pulse period is the time which goes by between successive switches of the output during the proportional control. The length of the pulse period must be chosen depending on dynamic object properties and suitably for the output device. For fast processes, it is recommended to use SSR relays. The relay output is used to steer contactors in slowchanging processes. The application of a high pulse period to steer fastchanging processes can give unwanted effects in the shape of oscillations. In theory, lowest the pulse period, better the control, but for a relay output it can be as large as possible in order to prolong the relay life.

Recommendations concerning the pulse period:
Table 3

| Output | Pulse period | Load |
| :---: | :---: | :---: |
| Electromagnetic <br> relay | Recommended $>20 \mathrm{~s}$, <br> min. 10 s | $2 \mathrm{~A} / 230 \mathrm{~V}$ a.c. |
|  | $\min .5 \mathrm{~s}$ | $1 \mathrm{~A} / 230 \mathrm{~V}$ a.c. |
| Transistor output | $1 \ldots 3 \mathrm{~s}$ | SSR relay |

## 8. CONTROL

### 8.1. ON-OFF Control

When a great accuracy of temperature control is not required, especially for objects with a great time constant and small delay, one can apply the on-off control with hysteresis. Advantages of this way of control are simplicity and liability, but disadvantage is the appearance of oscillations, even at small hysteresis values.

Output
Switched on

Fig. 16. Operation way of the heating output type

### 8.2. Innovative SMART PID algorithm

When a high accuracy of the temperature control is required, one must use the PID algorithm.
The applied innovative SMART PID algorithm is characterized by an increased accuracy for a widen class range of controlled objects.
The controller tuning of the object consists on the manual setting of the proportional element value, integration element, differentiation element, or automatically - by means of the auto-tuning function.

### 8.2.1. Auto-tuning

The controller has the function to select PID settings. These settings ensure in most of case an optimal control.

To begin the auto-tuning, one must transit to the tung (acc. to the fig. 13) and hold down the $\checkmark$ push-button during at least 2 seconds. If the control algorithm is set on on-off or the auto-tuning function is locked, then the tunk message will be hidden.
For the correct execution of the auto-tuning function, the setting of St.io and $5 \varepsilon . h$, parameters is required. One must set the 5 ELio parameter on the value corresponding to the measured value at the switched off control. For object temperature control, one can set $0^{\circ} \mathrm{C}$.
One must set the $5 t \cdot h$, parameter on the value corresponding to the maximum measured value when the control is switched on the full power.

The flickering ST symbol informs about the activity of the auto-tuning function. The duration of auto-tuning depends on dynamic object properties and can last maximally 10 hours. In the middle of the auto-tuning or directly after it, over-regulations can occur, and for this reason, one must set a smaller set point, if it possible.

The auto-tuning is composed of following stages:

- calculation of PID settings and stored them in the non-volatile memory, - beginning of PID control with new settings

$$
\begin{aligned}
& \text { - the error code is on the display, } \\
& \text { one must confirm it, } \\
& \text { - transition to the manual work mode. }
\end{aligned}
$$

The auto-tuning process will be stopped without counting PID settings, if a supply decay occurs or the $\longleftarrow$. push-button will be pressed. In this case, the control with current PID settings begins.
If the auto-tuning is not achieved with success, the error code acc. to the table 4 will be displayed.
Error codes for auto-tuning
Table 4

| Error code | Reason | How to proceed |
| :---: | :---: | :---: |
| $E S B:$ | P or PD control was selected. | One must select PI, PID control, i.e. the TI element must be higher than zero. |
| $E S E T$ | The set point value is incorrect. | One must change the temperature set-point or parameters st.io, sth. . Set point value should be in the range: <br> (56Lo $+10 \%$ of range <br> $5 t . h-10 \%$ of range) <br> range $=5$ Example: <br> $56: L_{0}=-50^{\circ} \mathrm{C}, 5 t \cdot \mathrm{H}_{1}=100^{\circ} \mathrm{C}$ <br> $\underset{=15^{\circ} \mathrm{C}}{ }=150^{\circ} \mathrm{C}, 10 \%$ of range $=15^{\circ} \mathrm{C}$ <br> set-point value range <br> ( $-35^{\circ} \mathrm{C}$... $135^{\circ} \mathrm{C}$ ) |
| ES03 | The $\longleftarrow$ push-button was pressed. |  |
| $E 584$ | The maximal duration time of auto-tuning was exceeded. | Check if the temperature sensor is correctly placed and if |
| $E S 85$ | The waiting time for switching was exceeded. | the set point value is not set too higher for the given object. |
| $E 506$ | The measuring input range was exceeded. | Pay attention for the sensor connection way. Do not allow that an over--regulation could cause the exceeding of the input measuring range. |
| $E S E S$ | Very non-linear object, making impossible to obtain correct PID parameter values, or noises have occurred. | Carry out the auto-tuning again. If that does not help, select manually PID parameters. |

### 8.2.2. Auto-tuning and "Gain Scheduling"

In case, when "Gain Scheduling" is used, one can carry out the auto-tuning in two ways.
The first way consist on choosing a suitable set of PID parameters, in which calculated PID parameters will be stored and realizing the autotuning on the level of the currently chosen set point value for the fixed set point control. One must set the $\boldsymbol{u t y}$ parameter on set, and choose Gset between $P_{1} \sigma^{\prime}$ and $P_{1} \boldsymbol{\sigma}^{\prime \prime}$.
The second way enables the automatic realization of the auto-tuning for all PID sets. One must set the $\sigma \in S$ parameter on $5 \rho$, and choose the number of PID sets for setting - parameter $6 \operatorname{Sno}$. Set point values for individual PID sets must be give in 59,593 , 593 , 594 parameters, from the lowest to the highest.

### 8.2.3. Proceeding Way in Case of a Dissatisfying PID Control

The best way to select PID parameters is to change the value into a twice higher or into a twice lower. During changes, one must respect following principles:
a) Oscillations:

- increase the proportional band,
- increase the integration time,
- increase the differentiation time.
b) Over-regulations:
- increase the proportional band,
- increase the differentiation time,
- increase the integration time.
c) Instability:
- increase the proportional band,
- increase the differentiation time.
d) Free jump response:
- decrease the proportional band,
- decrease the integration time.

| Run of controlledvalue | Algorithms of controller operations |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | P | PD | P | PID |
|  | Pb § | Pb tdd $\downarrow$ | pb ¢ | $\mathrm{Pb} \uparrow \mathrm{ti} \uparrow \mathrm{td} \downarrow$ |

|  | Pbl | Pb $\downarrow$ | ti $\downarrow$ | Pbl til |

Fig. 17. Way to correct PID parameters.

### 8.3. Step-by-step control

The controller's step-by-step control algorithm without feedback was changed.
The description is provided below.
The controller offers two algorithms of the step-by-step control for cylinder control:

- with no feedback signal from the valve - opening and closing of the valve is based on PID parameters and control deviation,
- with a feedback signal from the valve positioning device opening and closing of the valve is based on PID parameters, control deviation and valve position read from the additional input.

To select a step-by-step control, set one of the outputs out i...out 4 to 309 and one of the outputs out i...out' to $3: 1$. For the algorithm with no feedback - the parameter $F_{d} 6$ should be set to no, for the algorithm with a feedback - the parameter $F_{d} b$ should be set to $\Psi E S$. Additionally, set the insensitivity range for the set point, in which the valve does not change its position - the parameter Hin and select the set of PID parameters. Auto-tuning algorithm is not available for the step-by-step control.
For the algorithm with feedback signal the parameter , 2.5 i is available, that specifies the state of the valve when the feedback signal error on the secondary auxiliary input.

Step-by-step control with no feedback additionally requires the parameters settings: valve open time $\varepsilon$ ñ.uo, valve close time $\varepsilon$ हive, minimum valve work time inc.u.

Fig. 18. Three-step step-by-step control with no feedback

The principle of the algorithm shown in Fig. 18 is based on conversion of changing the control signal to the relay opening / closing time referred to the full opening / closing time.
The differences between the calculated and the actual valve position are unavoidable because of multiple changes in the direction of valve movement due to the inertia of a drive or its wear in the absence of a feedback. The controller uses the function of automatic positioning of a drive during operation to eliminate these differences. This function does not require user intervention and its function is to extend switching on time of the relay when the control signal reaches $0 \%$ or $100 \%$.

The relay for opening / closing will remain on for a time equal to the time of a valve full open / close from a moment of a signal reaching $100 \%$ / $0 \%$. The positioning of the valve will be stopped once the signal is different from the maximum value.
In the specific case, the positioning is performed by completely closing the valve, it is carried out each time after:

- turning the controller supply on
- changing full open / close time.

The time of full opening of the valve can have a different value than the time of closing.
Both parameters should be set to the same value when using a drive with identical times.

## 8.4. "Gain Scheduling" Function

For control systems, Where the object behaves decidedly differently in various temperatures, it is recommended to use the "Gain Scheduling" function. The controller allows to remember up to four sets of PID parameters and switch them over automatically. The switching between PID sets runs percussiveless and with hysteresis, in order to eliminate oscillations on switching limits.
The $6 \in \leftrightarrows$ parameter settles the way of the function operation.

| off | The function is disabled |
| :---: | :---: |
| 59 | a) Switching depending on the set point value. Additionally, one must also choose the number of PID sets - E.5nb, parameter, and set their switching levels $6 i: 2,4,23,6: 34$. <br> b) b) For the programmed control, one can set the PID set individually for each segment. Then for the given Prnn, program, in the PCG group, one must set the $P_{1}$ ó parameter on on. |
| sec | Permanently setting of one PID set. The PID set is set through the G5Et parameter. |

Fig 19. "Gain Scheduling" switched over from SP

Fig. 20. "Gain Scheduling" switched over for each segment in the programmed control

### 8.5. Control of Heating-cooling Type

For the heating-cooling control, one of the outputs out :...out' should be set to $\Psi$, one of the outputs out :...out'4 should be set to $C o o l$ and the displacement zone Hin for cooling should be configured.

For the heating loop, the PID parameters should be configured: $P_{b}, \boldsymbol{\varepsilon}, \boldsymbol{\varepsilon} \boldsymbol{\sigma}$, for the cooling loop the PID parameters: $\mathrm{Pb}, \boldsymbol{\varepsilon}, \boldsymbol{\varepsilon}, \boldsymbol{\varepsilon} \boldsymbol{\sigma} \mathbf{C}$. The parameter $\mathrm{P}_{\mathrm{b}} \mathrm{C}$ is defined as the ratio of the O parameter from the range 0.1...200.0 \%.

The pulse period for logic outputs (relay, SSR) is set independently for the heating and cooling loops (depending on the output, these are to i...とоч).

If there is the need to use the PID control in one loop and the ON-OFF control in the other loop, one output should be set to PID control and the other one upper relative alarm.

Fig.21. Control with two loops - heating-cooling type

## 9. ALARMS

Four alarms are available in the controller, which can be assigned: to each output. The alarm configuration requires the selection of the alarm kind through setting out $\mathbf{i}$, oute, out 3 and out 4 parameters on the suitable type of alarm. Available types of alarms are given on the fig. 22.

Relative lower [duio]

Relative internal [luen $n$ ]

Relative external [owou]

Fig. 22. Kinds of alarms

The set point value for absolute alarms is the value defined by the $\boldsymbol{R} .5 \boldsymbol{\rho}$, parameter, and for relative alarms, it is the deviation from the set point value in the main loop - Sx.d'w parameter. The alarm hysteresis, i.e. the zone around the set point value, in which the output state is not changed, is defined by the Ax. H 'l parameter.

One can set the alarm latch, i.e. the memorizing of the alarm state after stopping alarm conditions (parameter $\boldsymbol{\operatorname { X x } . i t = o n}$ ). The erasing of alarm memory can be made by the pressure of the $\longrightarrow \longleftarrow$ push-button in the normal working mode or interface.

## 10. TIMER FUNCTION

When reaching the set point temperature (SP) the timer begins the countdown of the time defined by the $\varepsilon, n \in$ time parameter. After counting down to zero, the timer alarm is set, which remains active till the moment of the timer erasing.

To activate the timer function, one must set the parameter $\varepsilon \cdot$ ir $=$ on. To indicate the alarm state on an output, one of the outputs out i...out 3 should be set to Ritrr.

The timer status/ remaining time is displayed with the mark " $\varepsilon$ " on the first position. To display it, one must press the
 push-button till the moment of it appearance on the lower display (acc. to the fig. 13).
The return to the set point value display is set by the manufacturer on 30 sec , but can be changed, or disabled using the tout parameter.

| Status | Description | Signaling |
| :---: | :---: | :---: |
| timer stopped |  | $\boldsymbol{E - -}$ |
| Starting of the timer | - temperature over SP <br> - Press the $\nabla$ push-button | Remaining time in minutes: e.g. (tこ299) |
| Pause of the timer | Press the $\checkmark$ push-button | Flickering remaining time in minutes |
| End of the countdown | Reaching zero by the timer | EEnd |
| Timer erasing | During the countdown: <br> Press <br> and $\square$ push- <br> buttons <br> After the countdown end: <br> - press the $\square$ push-button <br> - through the binary input |  |

Fig.23. Principle of timer operation

## 11. CURRENT TRANSFORMER INPUT

After connecting the current transformer (CT-94-1 type), the measurement and display of the current flowing through the load steered by the output 1 , is possible.
The first output must be of relay or voltage $0 / 5 \mathrm{~V}$ type. For the current counting, the minimal time of the output switching on must be at least 200 ms .

The transformer work range is equal 0 to 50 A . The heater current is displayed with the mark ${ }^{\prime}, \beta^{\prime \prime}$ in the first position.

In order to display the heater current, one must press the $\longleftarrow$ push-button till the moment of it appearance on the lower display. The return to the set point value display in set by the manufacturer on 30 sec , but can be changed or disabled through the cout parameter.

Two types of alarms concerning the heating element are available - the shorting alarm of the control element and the heater burnout alarm. The shorting alarm is realized by the current measurement when the control element is disabled, however the burnout alarm is realized when the control element is enabled.

The alarm configuration includes setting the alarm type. For the heater damage alarm oute...out $4=$ RLins, and for the controlling element damage alarm oute ... out $4=R 1.05$. Remaining parameters to set are the alarm set point value ho.5P, o.5.5P and the hons, os.rs hysteresis.

For a correct detection of the heater alarm burnout, the heating element cannot be connected later than the controller.

## 12. ADDITIONAL FUNCTIONS

### 12.1. Control Signal Monitoring

The control signal of heating type is displayed with the mark "h" on the first position, of cooling type is displayed with the mark ,"", of valve opening or closing is displayed with the mark "u". The access to the control signal depends on the suitable controller configuration. To display the control signal, one must press the $\downarrow$ push-button till the moment of its appearance on the lower display (acc. to the fig. 13). The return to the set point value display is set by the manufacturer on 30 sec. but it can be changed, or disabled through the tout parameter.

### 12.2. Manual Control

The input to the manual control mode follows after holding down the $\longleftarrow$, push-button during the control signal display. The manual control is signaled by the pulsation of the LED diode. The controller interrupts the automatic control and begins the manual control of the output. The control signal value is on the lower display, preceded by the symbol th" - for the main loop and „[" - for the auxidiary loop (cooling).

The $\square$ push-button serves to transit between loops (if the heating - cooling control mode is selected).

The $\boldsymbol{\nabla}$ and $\boldsymbol{\Delta}$ push-buttons serve to change the control signal. The exit to the normal working mode follows after the pressure of $\qquad$ push-button.

At set on-off control on the output 1 (parameter $\mathrm{PB}=0$ ), one can set the control signal on $0 \%$ or $100 \%$ of the power, however when the PB parameter is higher than zero, one can set the control signal on any value from the range $0 . . .100 \%$.

### 12.3. Signal Retransmission

The continuous output can be used for the retransmission of selected value, e.g. in order to the temperature recording in the object or the set point value duplication in multi-zone furnaces.

The signal retransmission is possible if the output 1 or 2 is of continuous type. We begin the signal retransmission from setting the out i or out? parameter into retr. Additionally, one must set the upper and lower limit of the signal to be retransmitted (Roto and Roh, ). The signal selection for retransmission is carried out through the Rofon parameter.

The recounting method of the retransmitted parameter into a suitable analog signal is shown on the fig. 24.

Fig. 24. Recounting of the signal for retransmission

The output signal is calculated acc. to the following formula.

$$
\text { out }_{x}=\text { out }_{\min }+(x-\text { Ao.Lo }) \frac{\text { out }_{\max }-\text { out }_{\min }}{\text { Ao.Lo-Ao.Hi}}
$$

The 9 parameter can be set as higher than Boin, but the output signal will be then inversed.

### 12.4. Set Point Change Rate - Soft Start

The limitation of the temperature accretion rate is carried out through the gradually change of the set point value. This function is activated after the controller supply connection and during the change of the set point value. This function allows to reach softly from the actual temperature to the set point value. One must write the accretion value in the SPrr, parameter and the time unit in the r-8is parameter. The accretion rate equals zero means that the soft start is disabled.

### 12.5. Digital Filter

In case when the measured value is instable, one can connect a programmed low-pass filter.
One must set the lowest time constant of the filter at which the measured value is stable. A high time constant can cause a control instability. One can set the filter time constant $F, i t$ from 0.2 up to 100 seconds.

Fig. 25. Time characteristic of the filter

### 12.6. Manufacturer's Settings

Manufacturer's settings can be restored during the supply connection by holding down $\square$ and $\square$ push-buttons, till the moment when the firbr inscription appears on the higher display.

1) See table 2.
2) The time unit is defined by the parameter $\varepsilon$ niven
3) The resolution to show the given parameter depends on the parameter dP - position of decimal point.
4) The time unit is defined by the parameter r.our

### 13.2. Definition of Set Point Value Programs

One can define 15 programs. The maximal number of segments in the program is equal to 15 .
To render visible parameters related to the programming control in the menu, the parameter 5Pind must be set on Pre. For each program, one must set parameters given in the submenu of program parameters. For each segment, one must select the kind of segment and next, parameters depending on the kind of segment acc. to the table 6. One must also set the output state (only when out i...out 4 are set to $\left.\varepsilon_{u} i, \varepsilon_{u}{ }^{2}, \varepsilon_{u} 3\right)$ - parameter $\varepsilon_{u}:, \varepsilon_{u}{ }^{2}, \varepsilon_{u} 3$.

List of segment configuration parameters
Table 6

|  | GYPE $=$ rRt $E$ | GYPE = duE: | cype $=$ End |
| :---: | :---: | :---: | :---: |
| t.5P | t.5P |  |  |
| $\varepsilon \cdot n \varepsilon$ | rr |  |  |
| hiou | hidu |  |  |

The fig. 26 and the table 7 represent an example of set point value program. It is assumed in the program that the temperature in the object has to increase from the initial temperature in the object up to $800^{\circ} \mathrm{C}$, with the rate of $20^{\circ} \mathrm{C}$ per minute, at the active locking from the deviation.
Next, during 120 minutes, the temperature is maintained (locking disabled), after that, the temperature has to decrease to $50^{\circ} \mathrm{C}$ during 100 minutes (locking disabled). During the object cooling, one must turn on the fan connected to the auxiliary output no 2 (parameter out? set on $\left.\varepsilon_{u} i\right)$.

Fig. 26. Example of program

Parameter values for the example as above.
Table 7

|  | Parameter | Value | Meaning |
| :---: | :---: | :---: | :---: |
| PCFE | Stre | Pu | Start to count the set point value from the current temperature |
|  | triun | нн.ani | Time unit: hour, minute |
|  | rrun | 动 0 | Unit for the accretion rate: minute |
|  | noto | bRind | Locking for the program: active -two-sided |
|  | cycn | 1 | Number of program repetitions |
|  | FR, $:$ | cont | Program continuation after a supply decay |
|  | End | $560 \%$ | Control stoppage after the program end |

| 5 cti : | ESPE | -REE | Kind of segment: accretion rate |
| :---: | :---: | :---: | :---: |
|  | c.5P | 800.0 | Target set point value: $800.0{ }^{\circ} \mathrm{C}$ |
|  | rr | 20.0 | Accretion rate $20.0{ }^{\circ} \mathrm{C} /$ minute |
|  | hidu | 50.0 | Active locking, when the deviation exceeds $50.0^{\circ} \mathrm{C}$ |
|  | Eu: | off | Output 2 as the auxiliary output Ev1: disabled |
| 56.02 | $\operatorname{tgPE}$ | duct | Kind of segment: withstand of set point value |
|  | $\varepsilon \cdot n \varepsilon$ | 02.00 | Segment time 2h00 = 120 minutes |
|  | Eu: | off | Output 2 as the auxiliary output Ev1 <br> - disabled |
| 56.03 | ESPE | E, in | Kind of segment: accretion time |
|  | c.5P | 50.0 | Target set point value: $50.0{ }^{\circ} \mathrm{C}$ |
|  | $\varepsilon \cdot n E$ | 01.40 | Segment time 1 $\mathrm{h} 40=100$ minutes |
|  | hidu | 0.0 | Inactive locking |
|  | Eu: | on | Output 2 as the auxiliary output Ev1: enabled |
| 56.04 | ESPE | End | Kind of segment: program end |
|  | Eu: | off | Output 2 as the auxiliary output Ev1: disabled |

### 13.3. Control of the Set Point Value Program

When the 5 Pind parameter is set on Pri, the controller controls the object in compliance with the set point value changing in time acc. to the given program. Before starting the control with the changeable set point value, one must select the required program (parameter ©PrE).
To start the program, one must press $\square$ and $\qquad$ push-buttons when the $5^{6} 0^{\circ}$ or $E n \sigma^{\prime}$ inscription appears on the lower display (fig. 27).
The lighted dot in the right corner of the lower display, means that the programming control is lasting. During the program duration, one can display parameters of the realized program, i.e. program status, program number, number of the operating segment, the number of cycles which still remains to carry out, time which goes by in the segment, time which remained to the end of the segment, time which remained to the program end.
After finishing the program the dot is gone out, or the program is renewed, if the number of the program repetition cyC is higher than 1.
After finishing the control, auxiliary outputs are in the state defined by parameters - output state for the segment set as the program end. When the parameter hoi $\sigma$ (locking in the program) is set on $\mathbf{i o}, \boldsymbol{h}$ or bRind and the locking value hid in the operating segment is higher than zero then, the size of the control deviation is controlled (set point value minus measured value). For hoi $\sigma=i 0$ the locking is active, when the measured value is below the set point value diminished by the locking value. For hoi $\sigma=h$, the locking is active, when the measured value exceeds the set point value by the locking value. For hoi $\sigma=b$ ind the locking is active, as for the upper and lower locking. If the locking is active then, the counting of the set point value is interrupted, and the dot in the right corner is flickering. The controller controls acc. to the last calculated set point value.

## 14. RS-485 INTERFACE WITH MODBUS PROTOCOL

### 14.1. Introduction

The RE82 controller is equipped with a serial interface in RS-485 standard, with implemented asynchronous communication protocol MODBUS.

The list of serial interface parameters for the RE82 controller:

- device address:
- baud rate:
- operating mode:
- information unit:
- data format:
- maximal response time:
- maximal number of registers read out/ written by a single Modbus frame: 116.

The RE82 controller realizes following protocol functions:
Table 8

| Code | Meaning |
| :---: | :--- |
| 03 | read out of n-registers |
| 06 | write of 1 register |
| 16 | write of $n$-registers |
| 17 | identification of the slave device |

### 14.2. Error Codes

If the controller receives a request with a transmission or checksum error, the request will be ignored. For a request synthetically correct but with incorrect values, the controller will send an answer including the error code.
Possible error codes and their meanings are presented in the table 9.

Error codes
Table 9

| Code | Meaning | Reason |
| :---: | :--- | :--- |
| 01 | forbidden function | The function is not serviced by the <br> controller. |
| 02 | forbidden data address | The register address is beyond the range. |
| 03 | forbidden data value | The register value is beyond the range or <br> the register is only to readout. |

### 14.3. Register Map

Map of register groups
Table 10

| Range <br> of addresses | Type of values | Description |
| :---: | :---: | :--- |
| $4000-4149$ | Integer <br> (16 bits) | The value is situated in a 16-bit register |
| $4150-5899$ | Integer <br> (16 bits) | The value is situated in a 16-bit register |
| $7000-7099$ | float <br> (2x16 bits) | The value is situated in two successive <br> $16-$ bit registers; Registers only for readout |
| $7500-7599$ | float (32 bits) | The value is situated in two successive <br> 32 -bit registers; Registers only for readout |

In the controller, data are situated in 16-bit registers. The list of registers for write and readout is presented in the table 11.
Operation „R-" - means the possibility of readout, and the operation „RW" means the possibility for readout and write.

Map of register from address 4000

The maximum allowable value of the control signal at the output can be defined with the Sint parameter. The mean value is measured at 1-minute intervals and only when the system deviation is lower than the i.Si parameter value. |
| 4123 | Y_mH | RW | 0... 1000 | Upper mean value limit |
| 4124 | L_Ym | RW | 0... 9999 | Maximum system deviation when calculating mean value |

${ }^{1)}$ Value with the decimal point position defined by bits 0 and 1 in the register 4003.
${ }^{2)}$ ) Parameter to write only in the manual operating mode
${ }^{3)}$ Concerns resistance thermometer inputs
${ }^{4)}$ Concerns thermocouple inputs
${ }^{5)}$ Concerns linear inputs
${ }^{6)}$ ) Range to write for continuous current outputs
${ }^{7)}$ Concerns output 1 of binary type
${ }^{8)}$ Concerns output 1 of continuous type.
9) For control P: $\mathrm{C}=$ onoF and $\mathrm{SFL}<=50 \%$, control signal $\mathrm{h}=0 \%$, SF: > 50\%, control signal h=100\%.

Register 4003 - controller status
Table 12

| bit | Description |
| :---: | :---: |
| 0-1 | Decimal point position for MODBUS registers from address 4000, depending on the input ( $0 \ldots 2)^{1)}$ |
| 2-3 | Decimal point position for MODBUS registers from address 4000, depending on the additional input ( $0 . . .2)^{1}$ ) |
| 4 | Auto-tuning finished with failure |
| 5 | Soft start: 1 - active, 0 - inactive |
| 6 | Timer status: 1 - countdown finished, 0 - remaining states |
| 7 | Automatic control/manual: 0 - auto, 1 - manual |
| 8 | Auto-tuning: 1 - active, 0 - inactive |
| 9-10 | Current set of PID parameters $0 \text { - PID1, } 1 \text { - PID2, } 3 \text { - PID3, } 4 \text { - PID4 }$ |
| 11-12 | Reserved |
| 13 | Measured value beyond the measuring range |
| 14 | Measured value on the additional input beyond the measuring input |
| 15 | Controller error - check the error register |

${ }^{1)}$ For sensor inputs value equal 1 , for linear inputs the value is depended on the parameter dp (register 4023)

| Bit | Description |
| :---: | :---: |
| 0 | State of alarm 1.:1-active, 0 - inactive |
| 1 | State of alarm 2.:1-active, 0 - inactive |

## 15. SOFTWARE UPDATING

Function enabling updating of software from the computer of the PC with software eCon was implemented in controller RE82 (from version of software 2.00). Free software eCon and update files are available at manufacturer's website. The connected to the computer convertor RS485 is required on USB to the updating, e.g.: the convertor PD10.
a)
b)

Fig.28. Program view: a) eCon, b) updating of software
Warning! Before doing update, currently settings of controller should be saved by program eCon, because when software is updated default settings of controller are restored.

After starting eCon's software COM port, baudrate, transmission mode and adress should be set. It can be done in Communication window. Then, RE82 controller should be selected in the window Select device and push icon Load in window Communication and then the icon § to read the current settings. Open window Lumel Updater (LU) -
figure 28b from Updating firmware. Push Connect. Update progress is shown in Messages section. Text Port opened appear after correctly opened port. Putting controller in update's mode can be done in two ways: remote from LU (with settings from eCon - port, baudrate, transmission mode and adress) or by turning power on while button pressed $\longleftarrow$. Message boot in the upper display signal the availability to update. LU will show message „Device found" with name and current version of firmware. Using button ... a valid file should be selected. If the file is correct, message File opened will show. Send button should be pressed. During firmware update the leds on the upper bargraph indicate process progress. If firmware update is successful device starts normal operation and message Done and update duration will show. Close LU and next press icon Upload configuration to device to restore previously read parameters. Current firmware version can be checked when controller is power on.

## Warning! Power loss during firmware update could result permanent controller damage!

## 16. ERROR SIGNALING

| Error code (upper display) | Reason | Procedure |
| :---: | :---: | :---: |
| - - - - | Down overflow of the measuring range or shorting in the sensor circuit. | Check, if the type of chosen sensor is in compliance with the connected one; check, if input signal values are situated in the appropriate range - If yes, check if there is no break in the sensor circuit. |
|  | Upper overflow of the measuring range or break in the sensor circuit. | Check, if the type of chosen sensor is in compliance with the connected one; check, if input signal values are situated in the appropriate range - If yes, check if there is no break in the sensor circuit. |
| Ers: | Incorrect controller configuration. | After selecting the valve opening on one output, the valve closing should be set on another output. |
| $E r .8{ }^{3}$ | Incorrect controller configuration. | After selecting the cooling type control on one output, the reverse control (heating) and the PID algorithm (ALG=PID) should be set on another output. |
| ES-- | Auto-tuning is ended with failure | Check the reason of the auto--tuning process interruption in the auto-tuning point. |

| $E r .8$ | Input discalibrated | Turn off and turn on again <br> the controller supply, when this <br> not help, contact the nearest <br> service shop. |
| :---: | :--- | :--- |
| $E r . E E$ | Continuous output <br> discalibrated | Turn off and turn on again <br> the controller supply, when this <br> not help, contact the nearest <br> service shop. |
| $E=$Error of readout veri- <br> fication from the non- <br> volatile memory. | Turn off and turn on again <br> the controller supply, when this <br> not help, contact the nearest <br> service shop. <br> The controller exploitation in his <br> state can cause its unforeseen <br> behavior. |  |

## 17. TECHNICAL DATA

## MAIN INPUT

Input signals and measuring ranges
Table19

| Sensor type | Standard | Range |  | ¢ हु |
| :---: | :---: | :---: | :---: | :---: |
| Pt100 | EN | $-200 . . .850^{\circ} \mathrm{C}$ | $-328 . .1562{ }^{\circ} \mathrm{F}$ | pt: |
| Pt1000 | 60751+A2:1997 | $-200 . . .850^{\circ} \mathrm{C}$ | $-328 . . .1562{ }^{\circ} \mathrm{F}$ | Pt ic |
| Fe-CuNi (J) | $\begin{gathered} \text { EN 60584- } \\ \text { 1:1997 } \end{gathered}$ | $-100 . . .1200^{\circ} \mathrm{C}$ | $-148 . .2192{ }^{\circ} \mathrm{F}$ | $t-u$ |
| Cu-CuNi ( ${ }_{\text {I }}$ |  | $-100 . . .400^{\circ} \mathrm{C}$ | -148...752 ${ }^{\circ} \mathrm{F}$ | $t-t$ |
| NiCr-NiAl (K) |  | $-100 . . .1372{ }^{\circ} \mathrm{C}$ | $-148 \ldots 2501,6^{\circ} \mathrm{F}$ | $t-\zeta$ |
| PtRh10-Pt (S) |  | 0... $1767^{\circ} \mathrm{C}$ | 32...3212,6 ${ }^{\circ} \mathrm{F}$ | t-5 |
| PtRh13-Pt (R) |  | 0... $1767^{\circ} \mathrm{C}$ | 32... $3212,6^{\circ} \mathrm{F}$ | $t-r$ |
| PtRh30-PtRh6 (B) |  | 0... $1767^{\circ} \mathrm{C}{ }^{1)}$ | $32 . .3212,6^{\circ} \mathrm{F}^{1)}$ | $t-b$ |
| NiCr-CuNi (E) |  | $-100 . . .1000^{\circ} \mathrm{C}$ | -148... $1832{ }^{\circ} \mathrm{F}$ | $t-\varepsilon$ |
| NiCrSi-NiSi ( N ) |  | $-100 . . .1300^{\circ} \mathrm{C}$ | $-148 . . .2372{ }^{\circ} \mathrm{F}$ | $t-n$ |
| Chromel-Kopel (L) | $\begin{gathered} \text { GOSTR8.585- } \\ 2001 \end{gathered}$ | $-100 . . .800^{\circ} \mathrm{C}$ | $-148 . .1472{ }^{\circ} \mathrm{F}$ | $t-1$ |
| Linear current ( I ) |  | $0 . .20 \mathrm{~mA}$ | $0 . .20 \mathrm{~mA}$ | 0-20 |
| Linear current (I) |  | $4 \ldots .20 \mathrm{~mA}$ | $4 \ldots . .20 \mathrm{~mA}$ | 4-20 |
| Linear voltage (U) |  | $0 . . .5 \mathrm{~V}$ | $0 . . .5 \mathrm{~V}$ | 0-5 |
| Linear voltage(U) |  | $0 . . .10 \mathrm{~V}$ | $0 . . .10 \mathrm{~V}$ | 0-10 |

${ }^{1)}$ The intrinsic error is related to measuring range $200 \ldots 1767{ }^{\circ} \mathrm{C}$ (392...3212,6 ${ }^{\circ} \mathrm{F}$ )

Intrinsic error of the real value measurement
$0.2 \%$, for resistance thermometer inputs,
$0.3 \%$, for inputs for thermocouple sensors ( $0.5 \%$ - for B, R, S);
$0.2 \% \pm 1$ digit, for linear inputs
Current flowing through the resistance thermometer sensor
0.22 mA
Measurement time
0.2 s

Input resistance:

- for voltage input
$150 \mathrm{k} \Omega$
- for current input $50 \Omega$

Error detection in the measuring circuit:

- thermocouple, Pt100, Pt1000
- 0... 10 V
- $0 . . .5 \mathrm{~V}$
- 0... 20 mA
- $4 . . .20 \mathrm{~mA}$
overrun of measuring range over 11 V
over 5.5 V
over 22 mA
over1 mA
and over 22 mA

## AUXILIARY INPUT

Measurement basic error of real value
$0.3 \% \pm 1$ digit

Measurement time
0.5 s

Input resistance $100 \Omega$

## Setting range of controller parameters:

See table 1

## Binary input

- shorting resistance
- opening out resistance

## Kinds of outputs 1 and 2:

- voltageless relay
- voltage transistor
- continuous voltage
- continuous current

Kinds of outputs 3 and 4:

- voltageless relay

NO contact, load capacity 1 A/230 V a.c.

Way of output operation:

| - reverse | for heating <br> - direct |
| :--- | :--- |
| for cooling |  |, | Error of analog outputs | $0.2 \%$ of the range |
| :--- | :--- |
| Digital interface | $\mathrm{RS}-485$ |
| - protocol | Modbus |
| - baud rate | $4800,9600,19200,38400$, |
|  | $57600 \mathrm{bit} / \mathrm{s}$ |

94

- mode
- address
- maximal response time

## Supply of object transducers

## Signaling:

- turning outputs $1,2,3,4$ on
- mode of manual control
- auto-tuning process
- turning binary inputs 1,2 on

## Rated operating conditions:

- supply voltage
- frequency of supply voltage
- ambient temperature
- storage temperature
- relative air humidity
- preheating time
- operating position
- resistance of wires connecting the resistance thermometer or the thermocouple with the controller

Power input

Weight

RTU - 8N2, 8E1, 8O1, 8N1
1... 247

500 ms

24 V d.c. $\pm 5 \%$, max.: 30 mA
85... 253 V a.c./d.c.
$20 . . .40 \mathrm{~V}$ a.c./d.c.
$40 \ldots 440 \mathrm{~Hz}$
0...23... $50^{\circ} \mathrm{C}$
$-20 \ldots+70{ }^{\circ} \mathrm{C}$
< 85 \% (condensation inadmissible)
30 min
any
$<20 \Omega$ / wire
$<6$ VA
$<0.2 \mathrm{~kg}$

Protection grade ensured by the casing

- from the frontal plate
- from the terminal side
acc. to EN 60529

## Additional errors in rated operating

 conditions caused by:- compensation of thermocouple cold junction temperature changes $\leq 2{ }^{\circ} \mathrm{C}$,
- ambient temperature change $\leq 100 \%$ value of basic error $/ 10 \mathrm{~K}$.

## Safety requirements acc. to EN 61010-1

- installation category

III,

- pollution level 2,
- maximal phase-to-earth operating voltage:
- for supply circuits, outputs 300 V
- for input circuits 50 V
- altitude above sea
< 2000 m

Electromagnetic compatibility

- noise immunity
- noise emissions
acc. to EN 61000-6-2
acc. to EN 61000-6-4

## 18. ORDERING CODE

The way of coding is given in the table 20.
Table 20

1)     - Only, when a relay or a $0 / 5 \mathrm{~V}$ voltage is also selected on the output 1 ,
2)     - Only after agreeing by the manufacturer
3)     - Only product label in Russian language

## Ordering Example:

The code RE82-1 21100 E 0 means:
RE82 - controller of RE82 type
1 - output 1: relay
2 - output 2: voltage $0 / 5 \mathrm{~V}$
1 - transducer supply 24 V d.c./ 30 mA
1 - supply: 85 .. 253 V a.c./ d.c.
00 - standard version
E - English version of user's manual
0 - without extra quality requirements.
